

Strabismus Research Update

ARVO Asia Brisbane 2017

Lionel Kowal Melbourne

**With help from recent Fellows
Drs Sheth, Kini, Mitchell**

No financial conflicts

Today: Some of the advances in recent years that have changed or are changing the understanding & treatment protocols and options in sensory and motor strabismus

חננו מאתך דעה בינה והשכל

AMBLYOPIA

PEDIG & MOTAS

- Rx often based on quantifying the sensory asymmetry & treating it with asymmetric treatments
- Glasses alone sometimes effective
- Less treatment is often as effective as more
- **Atropine** [used for 100 yrs] & **opaque occlusion** [used for 300 yrs] : equivalent effect for many pts
- ***There are NO other treatments still used in medicine that are as old as these***

21st Century Amblyopia Rx

High Tech Asymmetric Rx 1

Editorial

Treatment of amblyopia: the “eye pad,” or the iPad?

David G. Hunter, MD, PhD

For more than 100 years, ophthalmologists have been wagging their fingers at reluctant, amblyopic children, urging them to wear an eye patch that they do not want to wear, while frightened parents have coaxed, begged, bribed, threatened, and cajoled their stubborn little ones to comply. In the current issue of the *Journal of AAPOS*¹ and in a recent issue of the journal *Eye*,² Birch and colleagues have conducted the first pediatric studies of a binocular therapy for amblyopia that allows parents to offer their children not an eye patch but an iPad. In both studies, children who played games on a handheld tablet computer equipped with red-green glasses had a statistically significant improvement in visual acuity in the amblyopic eye. Vision was gained with as little as 4 hours of treatment in some cases, with a few patients improving to 20/20. Are we ready, then, to abandon the burden of forced monocular occlusion in favor of encouraging our young patients to play binocular video games on their tablet computers? Unfortunately, no, we are not—not just yet, anyway.

- Some published data. Many more papers presented @ meetings
- I expect this will a popular 1st treatment for amblyopia
- Commercial competition ++ expected.

Radiology of strabismus: Orbital pulleys

- Orbital pulleys have been recognised >100 yrs ['poules' in 19C French literature].
- Clinical relevance has been appreciated for ~20 years and practical application of the knowledge is growing fast

Today:

- Childhood pulley disorders
- Acquired pulley disorders – elderly and high myopes

Pulley surgeries:

- The medial rectus pulley
- The lateral rectus

Radiology of strabismus

Recent findings: orbital pulleys

Incomitant Strabismus Update

The Role of Extraocular Muscle Pulleys in Incomitant Non-Paralytic Strabismus

The medial rectus pulley suture:
a safer alternative to posterior scleral fixation

Medial rectus muscle pulley posterior fixation sutures in accommodative and partially accommodative esotropia with convergence excess

Logan Mitchell, MBChB, FRANZCO,^a and Lionel Kowal, MBBS, FRANZCO^{a,b,c}

BACKGROUND

The use of medial rectus pulley posterior fixation sutures to treat esotropia with convergence excess has limited support in the literature. We describe our results using this technique to treat patients with large near-distance disparities.

Each half of each EOM* has a unique
non-overlapping nerve supply

Compartmental-
ization of
extraocular muscle
function

JL Demer

* Compartmentalization not [yet?] demonstrated for superior rectus

abducens motor neuron pools. Humans, monkeys, and other mammals demonstrate separate, nonoverlapping intramuscular nerve arborizations in the superior *vs* inferior compartments of the medial rectus (MR) and lateral rectus (LR) EOMs that could apply force at the superior *vs* inferior portions of scleral insertions, and in the medial *vs* lateral compartments of the superior oblique that act at the equatorial *vs* posterior scleral insertions that might preferentially implement incycloduction *vs* infraduction.

Clinical implications of EOM compartmentalization

- 1. Sup compartment LR atrophy:

Esotropia – of – obscure - cause, not- quite LR palsy

Not rare

- 2. Sup compartment MR atrophy

Progressive exotropia – of- obscure- cause

Rare – no published cases yet

- 3. Medial / Lateral Sup Obl compartment atrophy

Probably explains why some have vertical diplopia vs torsional diplopia vs both V & T

4. Probably Many more incommittant clinical scenarios waiting to be appreciated

1. Esotropia & compartment hemi-atrophy

- Superior compartment atrophy of the LR produces a clinical condition that resembles LR paresis
- **Clinical picture: more LR function than complete palsy. Treatment implications uncertain**

Lateral Rectus Superior Compartment Palsy

ROBERT A. CLARK AND JOSEPH L. DEMER

Clark, R. A., & Demer, J. L. (2014). Lateral rectus superior compartment palsy. American Journal of Ophthalmology, 157(2)

Total RLR atrophy = palsy

Sup compartment RLR palsy

Clinical picture: more LR function than complete palsy. Treatment implications uncertain

Adult ET of uncertain cause

Delayed diagnosis of superior compartment LR paresis

2012 MRI re-read for purpose of a talk.
RLR has a triangular appearance

9 years after first presentation and 3 years after the last MRI and the 3rd horizontal rectus surgery, the diagnosis is clearer

Flap tear of the inferior rectus

Common / ? Commonest cause of vertical diplopia after orbital trauma

Normal [contralateral] IR

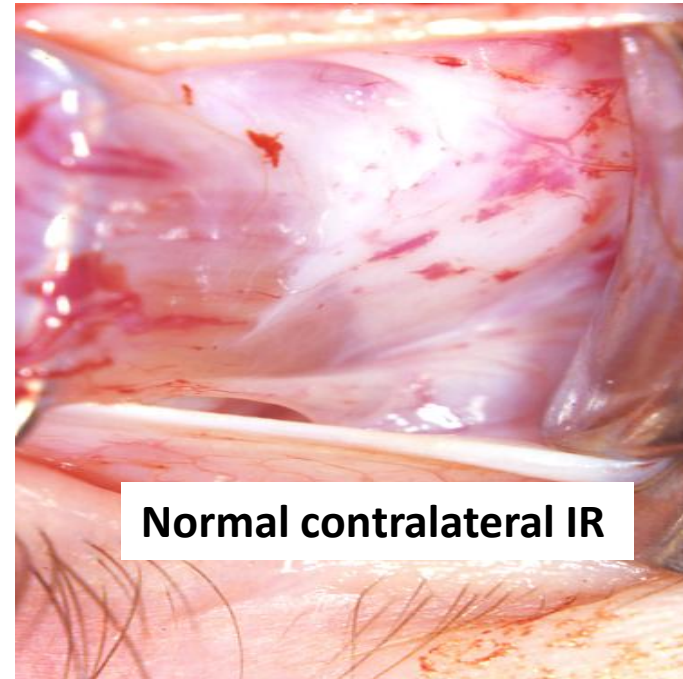

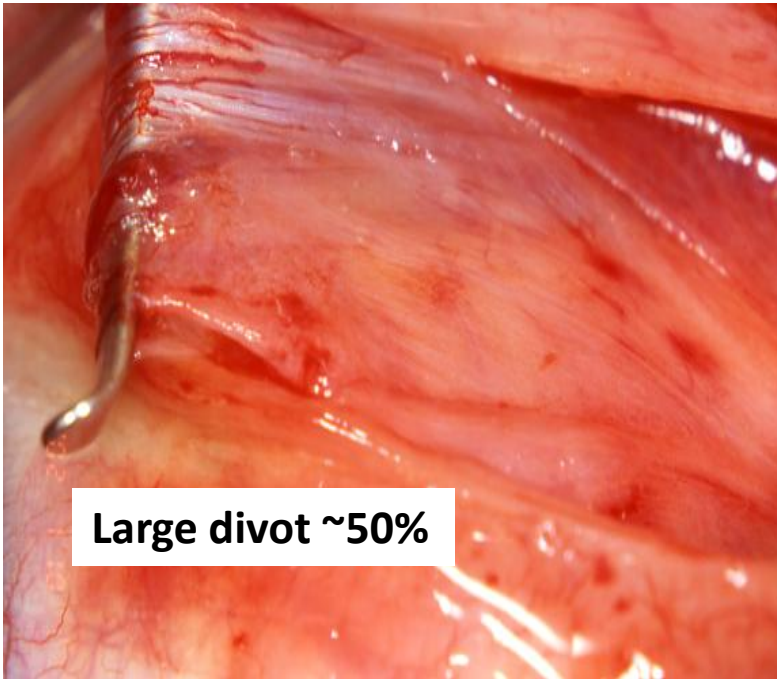

Superficial layer of inferior rectus 'shaved' off

**Affected IR
Outer ½ has been shaved off**

From Irene Ludwig

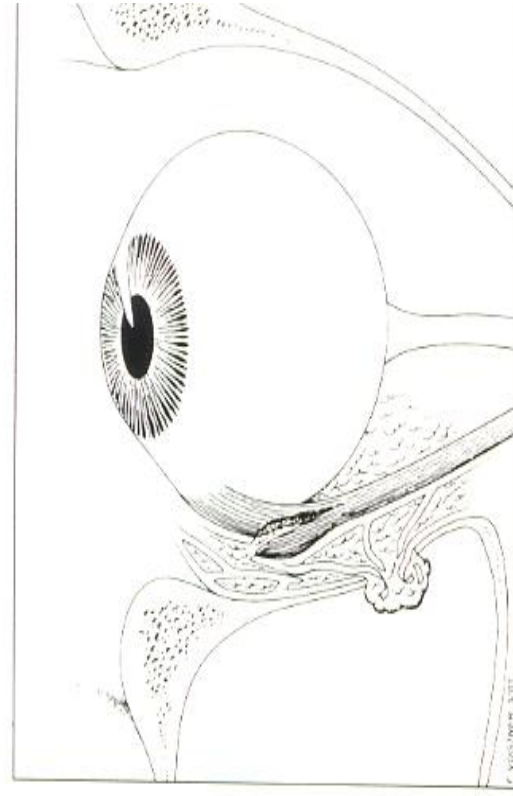

Example where 'divot' of muscle has been 'sliced' off

Flap Tear Hypothesis

From Irene Ludwig

- Blunt trauma causes outward traction on orbital septae.
- Orbital connective tissue, which attaches onto EOM pulls away portion of muscle & weakens it
- Flap can acts as a tether, further restricting & complicating motility.

to increased actin-myosin lattice spacing, so that density decreases.

2016 update ARVO & AAPOS MRI images of the flap tear

048 Magnetic resonance imaging (MRI) of inferior rectus (IR) flap tears. Tina G. Damarjian, Joseph L. Demer

Introduction: Thus far, the only evidence for existence of flap tears in EOMs has been observations during surgical repair. This study employed MRI to investigate anatomy of flap tears of the IR.

Methods: Five adults (ages 25-68 years) who sustained trauma to the IR were studied prospectively using a 1.5 Tesla MRI scanner with surface coils and fixation targets. Sagittal and coronal T2 sequences were performed in upward, downward, and central gaze for each eye, permitting comparison with age-matched controls.

Results: Patients exhibited infraduction limitation greatest in abduction, and incomitant ipsilateral hypertropia greatest in infraversion. All but one had associated orbital fractures. Three torn IRs exhibited a longitudinal fissure separating the orbital (OL) and global layers (GL), with avulsion of the GL from the sclera in one case, and avulsion of the OL from its pulley in two cases. Two involved IRs exhibited a longitudinal fissure separating medial portion of the GL that was attached to the sclera, from the avulsed lateral portion. All cases manifested extensive inferior orbital scarring. Surgical repair was possible in 3 cases.

Discussion: Blunt trauma may cause longitudinal tears in the IR having variable orientations: longitudinal separation of OL from

Validates Irene Ludwig's observations first published in 2001!

Intramuscular injection of 3% Bupivacaine BP with Botox BT to treat strabismus

- The unwanted changes caused by accidental injection of local anaesthetic agents like Bupivacaine into EOM during ocular anaesthetic procedures can be exploited to treat the 'weak' muscle in strabismus eg the MR in consecutive XT [combined with Botox BT to the LR].

Pharmacologic injection treatment of comitant strabismus

Iara Debert, MD, PhD,^{a,b,c,d} Joel M. Miller, PhD,^{a,b} Kenneth K. Danh, BS,^{a,b} and Alan B. Scott, MD^{a,b}

PURPOSE

To report the magnitude and stability of corrections in comitant horizontal strabismus achieved by injecting bupivacaine (BPX, optionally with epinephrine) and botulinum A toxin (BTXA) into extraocular muscles of alert adult subjects with electromyographic (EMG) guidance.
